

Alphabet Codes

In these questions, you need to find the code that has been applied to the letter combinations. Once you figure out how the code has been applied, you can find what the next letters are in the sequence.

Example:

If UYTC = WAVE then RMLC = _____

To find the code with these letters, we must look at each letter of the word individually.

With the first example, we need to count on two letters of the alphabet for each of the letters to decode it to the word it is. We can see this on the alphabet line as shown with the first letter from the code below:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

With the second letter, Y, as we reach the end of the alphabet, we go back to the start to continue counting.

As we count on two letters for each letter in the code, we can find that RMLC decoded is **TONE**.

Use the alphabet below to help you find your answers. Remember that you can count backwards as well as forwards and that there will always be a pattern, but the same rule might not apply to every letter in the word.

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
